Art Unit: 1723

DETAILED ACTION

Claims 1-48 are pending, of which 1-12 are withdrawn from consideration.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

- 1. Determining the scope and contents of the prior art.
- 2. Ascertaining the differences between the prior art and the claims at issue.
- 3. Resolving the level of ordinary skill in the pertinent art.
- 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.
- 1. Claims 13 and 16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Srinivas et al (US 6,444,302 B1) in view of Bierenbaum et al (US 3,426,754).

Srinivas (302) teaches a method of preparation of a microporous membrane (breathable membrane) comprising domains of a first polymer uniformly distributed in a second polymer (abstract), second polymer comprising three dimensional network of pores (col 2 line 63-col 3 line 37), film composition in the range of having first polymer 1-35% and second polymer >65%, second polymer immiscible with the first, stretching (col 9 line 43-col 10 line 20, col 11 lines 14-32) as in instant claim 13.

Art Unit: 1723

Srinivas does not specifically teach the porosity as 5-40% and pore dia as 1-200 nm.

Bierenbaum teaches a breathable film to have 10-50% porosity and pore dia 10-500 nm (col 2 lines 24-41). It would be obvious to one of ordinary skill in the art at the time of invention to infer from the teaching of Bierenbaum that the porosity and the pore dia of the breathable membrane of Srinivas could also be made in the same range as that of Bierenbaum for use as a breathable membrane.

Claim 16 adds the further limitation of extrusion (see col 10 lines 24-30)

 Claim 14 is rejected under 35 U.S.C. 103(a) as being unpatentable over Srinivas (302) in view of Bierenbaum et al (754) as applied to claim 13 above, and further in view of Perez et al (US 6,331,343 B1).

Srinivas (302) in view of Bierenbaum et al (754) does not teach casting the membrane. Perez teaches casting the membrane which is formed from a mixture of two immiscible polymers (col 7 lines 49-67). It would be obvious to one of ordinary skill in the art at the time of invention to use the teaching of Perez in the teaching of Srinivas (302) in view of Bierenbaum et al (754) for obtaining very thin films as taught by Perez.

3. Claim 15 is rejected under 35 U.S.C. 103(a) as being unpatentable over Srinivas (302) in view of Bierenbaum et al (754) as applied to claim13 above, and further in view of JP 58-020273.

Srinivas (302) in view of Bierenbaum et al (754) does not teach spray application for making the membrane. JP'273 teaches electrostatic spray application of the composition on a substrate. (4-fig). It would be obvious to one of ordinary skill in the art at the time of invention to use the

Art Unit: 1723

teaching of JP'273 in the teaching of Srinivas (302) in view of Bierenbaum et al (754) to make the membrane to avoid using solvents.

4. Claims 17-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Srinivas (302) in view of Bierenbaum et al (754) as applied to claim 13 above, and further in view of Fisher et al (US 5,013,439.

Srinivas (302) in view of Bierenbaum et al (754) teach cold stretch or hot stretch (by the temperature conditions) but not cold stretch before hot stretch as in claim 17-20 and annealing at 5-10 C higher than the hot stretching step as in claim 20. Fisher (439) teaches cold stretching at about 15-25C to about 30% more than the original dimension (col 6 lines 26-40) before hot stretching (col 7 lines 54-65) line and annealing (col 5 lines 42-55) above the hot stretch temperature to make microporous membranes using thermoplastic polymers like polypropylene. It would be obvious to one of ordinary skill in the art at the time of invention to use the teachings of Fisher (439) in the teaching of Srinivas (302) in view of Bierenbaum et al (754) to obtain decreased pore size and increased pore densities as taught by Fisher (439) (abstract).

5. Claims 21-23 and 26-30 are rejected under 35 U.S.C. 103(a) as being unpatentable over Srinivas (302) in view of Bierenbaum et al (754) as applied to claim 13 and 16-20 above and further in view of Shibata et al (US 6,217,687).

Srinivas (302) in view of Bierenbaum et al (754) does not teach the compatibilizing block copolymer as in claims 21-23. Shibata (687) teaches such a compatibilizing co-polymer for improving the stretchability (col 5 lines 8-13) in a thermoplastic microporous membrane formed by polyethylene and having an immiscible minor component like PBT (col 5 lines 58-65). It would be obvious to one of ordinary skill in the art at the time of invention to use the teaching of Shibata

Art Unit: 1723

(687) in the teaching Srinivas (302) in view of Bierenbaum et al (754) for improving the stretchability of the membrane as taught by Shibata.

Claims 26-30 adds further limitations as discussed in claims 16-20 as above.

6. Claim 24 is rejected under 35 U.S.C. 103(a) as being unpatentable over Srinivas (302) in view of Bierenbaum et al (754) and Shibata (687) as applied to claim 21 above and further in view of Perez (343).

Srinivas (302) in view of Bierenbaum et al (754) and further in view of Shibata (687) does not teach casting as the process for making the membrane. Perez teaches casting the membrane which is formed from a mixture of two immiscible polymers (col 7 lines 49-67). It would be obvious to one of ordinary skill in the art at the time of invention to use the teaching of Perez in the teaching of Srinivas (302) in view of Bierenbaum et al (754) and Shibata (687) for obtaining very thin films as taught by Perez.

7. Claim 25 is rejected under 35 U.S.C. 103(a) as being unpatentable over Srinivas (302) in view of Bierenbaum et al (754) and Shibata (687) as applied to claim 21 above and further in view of IP'273.

Srinivas (302) in view of Bierenbaum et al (754) and Shibata (687) does not teach spray coating on a substrate. JP'273 teaches electrostatic spray application of the composition on a substrate (4-fig). It would be obvious to one of ordinary skill in the art at the time of invention to use the teaching of JP'273 in the teaching of Srinivas (302) in view of Bierenbaum et al (754) to make the membrane without using solvents.

Art Unit: 1723

8. Claims 31-38 are rejected under 35 U.S.C. 103(a) as being unpatentable over Srinivas et al (US 6,444,302 B1) in view of Bierenbaum et al (US 3,426,754).

Srinivas (302) teaches a membrane (breathable membrane) comprising domains of a first polymer uniformly distributed in a second polymer (abstract), second polymer comprising three dimensional network of pores (col 2 line 63-col 3 line 37), film composition in the range of having first polymer 1-35% and second polymer ×65%, second polymer immiscible with the first, stretching (col 9 line 43-col 10 line 20) as in instant claim 31.

Srinivas does not specifically teach the porosity as 5-40% and pore dia as 1-200 nm.

Bierenbaum teaches a breathable film to have 10-50% porosity and pore dia 10-500 nm (col 2 lines 24-41). It would be obvious to one of ordinary skill in the art at the time of invention to infer from the teaching of Bierenbaum that the porosity and the pore dia of the breathable membrane of Srinivas could also be in the same range as that of Bierenbaum for use as a breathable membrane.

Claims 32-38 and the rest of the limitations of claim 31 describe specific process steps in the formation of the membrane. "[E]ven though product-by-process claims are limited by and defined by the process, determination of patentability is based on the product itself. The patentability of a product does not depend on its method of production. If the product in the product-by-process claim is the same as or obvious from a product of the prior art, the claim is unpatentable even though the prior product was made by a different process." In re Thorpe, 777 F.2d 695, 698, 227 USPQ 964, 966 (Fed. Cir. 1985).

9. Claims 39-48 are rejected under 35 U.S.C. 103(a) as being unpatentable over Srinivas (302) in view of Bierenbaum et al (754) as applied to claim 31 above and further in view of Shibata et al (US 6,217,687).

Art Unit: 1723

Srinivas (302) in view of Bierenbaum et al (754) does not teach the compatibilizing block copolymer. Shibata (687) teaches such a compatibilizing co-polymer for improving the stretchability (col 5 lines 8-13) in a thermoplastic microporous membrane formed by polyethylene and having an immiscible minor component like PBT (col 5 lines 58-65). It would be obvious to one of ordinary skill in the art at the time of invention to use a compatibilizing copolymer in the membrane as taught by Shibata (687) in the membrane as taught Srinivas (302) in view of Bierenbaum et al (754) for improving the stretchability as taught by Shibata.

Re claims 40-48, these claims are product by process. "[E]ven though product-by-process claims are limited by and defined by the process, determination of patentability is based on the product itself. The patentability of a product does not depend on its method of production. If the product in the product-by-process claim is the same as or obvious from a product of the prior art, the claim is unpatentable even though the prior product was made by a different process." In re Thorpe, 777 F.2d 695, 698, 227 USPQ 964, 966 (Fed. Cir. 1985)

Response to Arguments

Applicant's arguments with respect to claims 13-48 have been considered but are moot in view of the new ground(s) of rejection.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Krishnan S Menon whose telephone number is 703-305-5999. The examiner can normally be reached on 8:00-4:30.

Art Unit: 1723

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Wanda L Walker can be reached on 703-308-0457. The fax phone numbers for the organization where this application or proceeding is assigned are 703-872-9310 for regular communications and 703-872-9311 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 703-308-0661.
